

Imagine...clearer skin with ClearLight™ Acne Therapy

What is the ClearLight system?

The ClearLight system is a unique new therapeutic light that treats moderate inflammatory acne. ClearLight uses the innovative Acne PhotoClearing™ (APC™) technology to destroy the most common bacteria that causes acne – quickly and easily.

How effective is it?

ClearLight effectively clears most moderate inflammatory acne in four weeks – see graph.

Acne PhotoClearing (APC) Technology
vs. Other Treatment Modalities

After 8 ClearLight treatments
and 2 months of follow up

Innovative technology that is safe and effective

Is it safe? Are there any side effects?

ClearLight is one of the safest acne treatments available. Its APC technology uses light that is UV-safe. With ClearLight there are no known side effects.

Traditional acne treatments can have a variety of side effects. Topical therapies like creams and lotions often cause redness, irritation, and/or peeling. Oral therapies, like antibiotics, may have other side effects. Both may require at least 3 months of continuous treatment; conditions often become worse before they improve, and scarring remains an issue.

Who can be treated by ClearLight?

Almost anyone. ClearLight has proven to be very effective on moderate inflammatory acne. Pregnant women and people with photosensitivity should consult with their physician. Since most people can benefit from treatment, talk to your doctor about ClearLight.

What you can expect

How ClearLight works...

ClearLight's unique APC technology destroys *P. acnes* bacteria safely and effectively within the skin.

BEFORE TREATMENT: A pimple forms around the hair follicle opening, causing inflammatory acne with an abnormal amount of bacteria called *P. acnes*.

DURING TREATMENT: ClearLight's APC technology uses intense, 405 – 420nm wavelength light, which permeates the tissue to reach the *P. acnes* target safely and effectively.

AFTER TREATMENT: The *P. acnes* bacteria have been eliminated.

What happens during ClearLight treatment? Does it hurt?

With ClearLight, a typical treatment session takes only 15 minutes. You lie comfortably while the therapeutic light is applied; sometimes there is a slight warm sensation. ClearLight treatments are described as easy, even relaxing, but most importantly – painless and safe. Patients often listen to music while being treated.

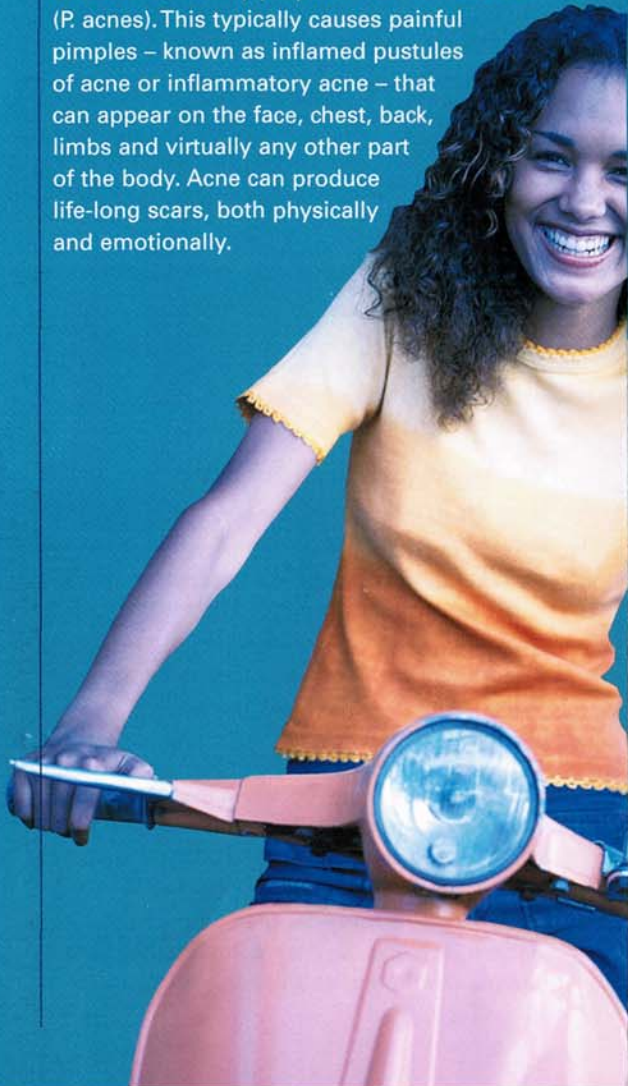

How many treatments are required?

Your doctor can tell you about the treatment plan that is right for you. It will involve a series of ClearLight treatment sessions, typically twice a week for 4 weeks. It is important to keep the treatment appointments recommended by your doctor. By following the treatment plan, you'll see maximum results and enjoy clearer skin with ClearLight.

A few facts about acne

Studies indicate that most people experience acne in some form at some time in their life. Acne usually begins during adolescence but often continues into adulthood. Hormonal changes cause the enlargement and blocking of oil-producing sebaceous glands near the hair follicle within the skin.

Acne usually begins with an abnormal amount of bacteria, mainly propionibacterium acnes (P. acnes). This typically causes painful pimples – known as inflamed pustules of acne or inflammatory acne – that can appear on the face, chest, back, limbs and virtually any other part of the body. Acne can produce life-long scars, both physically and emotionally.

ClearLight™ advantages

- A new paradigm for acne treatment
- Short treatment regimen – 8 treatments over 4 weeks to achieve impressive results
- No side-effects. No pain. No downtime
- Systemic drug-free treatment
